

EMS for a multiple construction site project

Client: Consulting company

Service employed: EMS experts

Duration: 2017 - today

The Environmental Management System (EMS) is a significant part of the environmental license for each project and should be implemented both during the construction and the operation phase. We have been appointed to supervise the EMS of a multiple construction site project.

During this assignment a tailor-made methodology was prepared, and two checklists were developed (for general and for day-to-day use). Audits to all construction sites carried out by ENYDRON, while the engineers of the client were trained to be capable of identifying the main environmental impacts of each construction site and properly reporting any environmental incident. Data acquired for each construction site are collected at least twice per month and elaborated accordingly.
